#### **Endocrine Disruptors (Eds) or Endocrine Disruptor Chemicals (EDCs)**

An endocrine disruptor is a compound have been shown to possess endocrine-disrupting properties with an ability to interfere in the actions of many hormones and to contribute to human health problems. Much of the reported disruptive activity has been in relation to the action of estrogens, androgens, and thyroid hormones, and concerns have been raised for adverse consequences on female and male reproductive health, thyroid function, metabolic alterations, brain development/function, immune responses, and development of cancers in hormone-sensitive tissues. These compounds for now are Bisphenol A (BPA), Dioxins, Atrazine, Phthalates, Perchlorate, Fire Retardants, Lead, Arsenic, Mercury, Perfluorinated Chemicals (PFCs) Organophosphate Pesticides and Glycol Ethers such as 2-butoxyethanol (EGBE) and methoxydiglycol (DEGME).

These compounds are not intentionally added to the manufacturing process of these products. The EU list is up to date at *April*, 2022.

#### Halogenated Flame Retardants, HFR

Bromine, chlorine, fluorine and iodine, are the elements in the chemical group known as halogens. Halogenated flame retardants act directly on the flame, the core of the fire.

Flame retardants are found at increasing levels in household dust, human blood and breast milk, and wild animals. The chemicals are widely distributed in the outdoor environment with the highest concentrations in the Arctic and marine mammals.

Many halogenated flame retardants are found to be persistent, bioaccumalative and/or toxic (PBT). 'Persistent' means that the compounds do not break down into safer chemicals in the environment through time, probably, in the case of fire retardants, many years. 'Bioaccumalative' means that the compounds accumulate in plants and animals and become more concentrated as they move up the food chain.

Most research into the effects on human health of fire retardants has concentrated on brominated FR. Chlorinated fire retardants are currently considered 'safer'.

Effects of brominated FR:

- No acute toxicity
- Chronic toxicity
  - Endocrine disruption effecting neurodevelopment and reproductive systems
  - Immune suppression
  - Carcinogencity

The following types of brominated flame retardants are not intentionally used by our suppliers in these products:

#### Non-Intentionally Added Substances, NIAS

EU Commission Regulation N° 10/2011 notes that not all contaminants and reaction products of authorised monomers and additives can be listed in its Annex I. The identification of non-listed migrants may therefore not be an exclusion criterion in itself. However, a toxicological evaluation of these migrants needs to be performed.

The major fractions of NIAS in Polyolefins are the oligomers, which are unavoidably formed during polymerisation and cannot be removed. A recent joint study of polyolefin producers demonstrated that oligomers migrating from all types of polyolefins only consist of linear and branched alkanes (*Polyolefin oligomeric saturated hydrocarbons*, POSH) and alkenes (*Polyolefin Oligomeric Mono-unsaturated Hydrocarbons*, *POMH*), no cyclic or aromatic compounds were found. The toxicological assessment of such migrants concluded that they are sufficiently characterised by the existing overall migration limit.
